Stefan Huber, Oswin Aichholzer, Thomas Hackl, Birgit Vogtenhuber: Straight Skeletons By Means of Voronoi Diagrams

# Straight skeletons

- Wavefront propagation:
  - At time t the wavefront  $W_{\mathcal{S}}(t)$  forms a mitered offset.
  - Events: structural changes of the wavefront over time.
- S(P) is the set of loci traced out by vertices of  $W_S(t)$ .

(B)

### Straight skeletons

- Wavefront propagation:
  - At time t the wavefront  $W_{\mathcal{S}}(t)$  forms a mitered offset.
  - Events: structural changes of the wavefront over time.
- S(P) is the set of loci traced out by vertices of  $W_S(t)$ .

### Voronoi diagrams

► Given:

- ► A metric space (ℝ<sup>d</sup>, ||.||).
- A finite set  $S = \{s_1, \ldots, s_n\}$  of *input sites*.
- ▶ Voronoi region  $\mathcal{R}(s_i, S) = \{q \in \mathbb{R}^d : ||q s_i|| \le ||q s_j||, 1 \le j \le n\}.$
- Voronoi diagram  $\mathcal{V}(S) = \bigcup_{i=1}^n \partial \mathcal{R}(s_i, S)$ .

# Voronoi diagrams

Given:

- A metric space  $(\mathbb{R}^d, \|.\|)$ .
- A finite set  $S = \{s_1, \ldots, s_n\}$  of *input sites*.
- ▶ Voronoi region  $\mathcal{R}(s_i, S) = \{q \in \mathbb{R}^d : ||q s_i|| \le ||q s_j||, 1 \le j \le n\}.$
- Voronoi diagram  $\mathcal{V}(S) = \bigcup_{i=1}^n \partial \mathcal{R}(s_i, S).$

3 D ( 3 D)

# Voronoi diagram of a polygon

- Given: A polygon (with holes) *P*.
- ▶ Interpret the vertices and edges of *P* as input sites *S*.

$$\blacktriangleright \mathcal{V}(P) = \mathcal{V}(S) \cap P.$$

•  $\mathcal{V}(P)$  tessellates P into Voronoi regions.

프 > - \* 프 >

# Voronoi diagram of a polygon

- Given: A polygon (with holes) P.
- ▶ Interpret the vertices and edges of *P* as input sites *S*.
- $\blacktriangleright \mathcal{V}(P) = \mathcal{V}(S) \cap P.$

•  $\mathcal{V}(P)$  tessellates P into Voronoi regions.

∢ 문 ► < 문 ►

# Straight skeleton versus Voronoi diagram

- The straight skeleton does not fit into the Abstract Voronoi Diagram framework of Klein.
- Computing  $\mathcal{S}(P)$  is  $\mathcal{P}$ -complete.
- ▶ The straight skeleton is prone to non-local effects.
- S(P) changes discontinuously when moving vertices of P.

TL'DR: The straight skeleton is fundamentally different from the Voronoi diagram.

글 > - < 글 > -

## Straight skeleton versus Voronoi diagram

- The straight skeleton does not fit into the Abstract Voronoi Diagram framework of Klein.
- Computing  $\mathcal{S}(P)$  is  $\mathcal{P}$ -complete.
- The straight skeleton is prone to non-local effects.
- S(P) changes discontinuously when moving vertices of P.

#### TL'DR: The straight skeleton is fundamentally different from the Voronoi diagram.

On the other hand:

- *P* rectilinear,  $(\mathbb{R}^2, \|.\|_{\infty})$ :  $\mathcal{V}(P) = \mathcal{S}(P)$ .
- ▶ *P*'s reflex vertices "rounded",  $(\mathbb{R}^2, \|.\|_2)$ :  $\mathcal{V}(P) = \mathcal{S}(P)$ .

### Question

Under which circumstances is  $\mathcal{V}(P) = \mathcal{S}(P)$ ?

A B + A B + 
 A

Best of both worlds:

- Optimal algorithms for  $\mathcal{V}(P)$  in  $\mathbb{R}^2$  known, but not for  $\mathcal{S}(P)$ .
- Definition for  $\mathcal{S}(P)$  in  $\mathbb{R}^3$  is a pain, but not for  $\mathcal{V}(P)$ .
- S(P) comprises piecewise-linear features only, but V(P) does not.
- $\mathcal{V}(P)$  changes continuously,  $\mathcal{S}(P)$  does not, et cetera.

### Voronoi diagrams by means of wavefronts

# ► $X, Y \subseteq \mathbb{R}^d$ :

- $X \oplus Y = \{x + y \colon x \in X, y \in Y\}.$
- $X \ominus Y = \{z \in \mathbb{R}^d : \{z\} \oplus Y \subseteq X\}.$
- Unit ball  $B = \{x \in \mathbb{R}^d : ||x|| \le 1\}.$
- Minkowski offset  $\mathcal{W}_{\mathcal{V}}(t) = \partial(P \ominus tB)$ .

### Voronoi diagrams by means of wavefronts

$$= P \cap \partial(\partial P \oplus tB)$$
$$= P \cap \bigcup_{\text{face } s \text{ of } \partial P} \mathcal{R}(s, P) \cap \partial(s \oplus t \cdot B)$$

Stefan Huber, Oswin Aichholzer, Thomas Hackl, Birgit Vogtenhuber: Straight Skeletons By Means of Voronoi Diagrams

문▶ ★ 문▶

# Voronoi diagrams by means of wavefronts

- $\mathcal{V}(P)$  is the interference pattern of the wavefront  $\mathcal{W}_{\mathcal{V}}$ .
- The norm  $\|.\|$  can be specified by a unit ball *B*:
  - $||x||_B = \inf\{t \ge 0 \colon x \in tB\}$  for any  $x \in \mathbb{R}^d$ .

### Question

For which unit balls B and for which input shapes P is  $W_S(t) = W_V(t)$  for all  $t \ge 0$ ?

### Proper unit balls

 $\|.\|_B$  shall be a norm:

B needs to be convex and o-symmetric.

 $\mathcal{W}_{\mathcal{S}}(t)$  has a piecewise-linear geometry.

- ▶  $\partial(P \ominus tB)$  comprises features of *P* and *B*.
- For  $W_{\mathcal{S}}(t) = W_{\mathcal{V}}(t)$ , *B* needs to be polyhedral.

At least for P = B we would like that  $W_S(t) = W_V(t)$ .

- $\blacktriangleright \mathcal{W}_{\mathcal{V}}(t) = (1-t)B.$
- ▶ All facets of  $W_V$  reach *o* at time 1.
- ▶ All facets of *W*<sub>S</sub> need to reach *o* at time 1.
- ▶ All facets of *B* have distance 1 to *o*.
- ▶ We call such a *B* isotropic.

글 > - < 글 >

## Proper unit balls

### Definition

A proper unit ball is a convex, o-symmetric, isotropic polyhedron.

#### Lemma

For a proper unit ball B and any  $v \in \mathbb{R}^d$  it holds that  $||v||_2 \ge ||v||_B$ , and equality holds exactly when v is a normal vector of a facet of B.

# Proper input shapes

### Definition

A (*d*-dimensional) input shape P is a connected, compact set in  $\mathbb{R}^d$  whose boundary forms a polyhedral surface that constitutes an orientable (d-1)-manifold.

### Definition

A face f of P of dimension at most d-2 is called *reflex* if for any point p in the relative interior of f and for any Euclidean ball O, which is centered at p and has sufficiently small but positive radius,  $O \setminus P$  is contained in a half-space whose boundary supports p.

# Corresponding facets

For a facet f of P let n(f) be the normal vector of f pointing to the interior.

#### Lemma

Every facet f of P has a corresponding facet  $f^B$  of B that has n(f) as the outer normal vector, unless  $W_{\mathcal{V}}(\varepsilon) \neq W_{\mathcal{S}}(\varepsilon)$  for some  $\varepsilon > 0$ .

# Two-dimensional input shapes

The last lemma says:

• For every edge e of P there is a corresponding edge  $e^B$  of B.

#### Lemma

Let v be a reflex vertex of P with incident edges  $e_1$  and  $e_2$ . Then there is a corresponding vertex  $v^B$  of B that is incident to  $e_1^B$  and  $e_2^B$ , unless  $\mathcal{W}_{\mathcal{V}}(\varepsilon) \neq \mathcal{W}_{\mathcal{S}}(\varepsilon)$  for some  $\varepsilon > 0$ .

The existence of corresponding edges and reflex vertices is necessary for  $W_V(t) = W_S(t)$ .

# Two-dimensional input shapes

### Definition

A proper input shape P w.r.t. a proper unit ball B in  $\mathbb{R}^2$  is a polygon with holes such that

- (11) for each edge e of P there is a corresponding edge  $e^B$  of B whose outer normal vector is n(e) and
- (12) for each reflex vertex v of P, incident to edges  $e_1$  and  $e_2$ , there is a corresponding vertex  $v^B$  of B that is incident to  $e_1^B$  and  $e_2^B$ .

### Theorem

For a proper input shape P w.r.t. a proper unit ball B in  $\mathbb{R}^2$  it holds that  $\mathcal{W}_{\mathcal{S}}(t) = \mathcal{W}_{\mathcal{V}}(t)$  for all  $t \ge 0$ .

A = A = A

# Higher-dimensional input shapes

We know: each facet f of P has a corresponding facet  $f^B$  in B.

For d = 2: a proper input shape looks locally the same as a unit ball at non-convex features.

- For d > 2 we have a larger "diversity" of non-convexity.
- For (d-2)-dimensional faces the situation is still simpler.

#### Lemma

Let P be an input shape in  $\mathbb{R}^d$ , where  $d \ge 2$ . For each reflex (d - 2)-dimensional face e of P, which is incident to facets  $f_1$  and  $f_2$ , it holds that  $f_1^B \cap f_2^B \neq \emptyset$ , unless  $\mathcal{W}_{\mathcal{V}}(\varepsilon) \neq \mathcal{W}_{\mathcal{S}}(\varepsilon)$  for some  $\varepsilon > 0$ .

# Higher-dimensional input shapes

We know: each facet f of P has a corresponding facet  $f^B$  in B.

For d = 2: a proper input shape looks locally the same as a unit ball at non-convex features.

- For d > 2 we have a larger "diversity" of non-convexity.
- For (d-2)-dimensional faces the situation is still simpler.

#### Lemma

Let P be an input shape in  $\mathbb{R}^d$ , where  $d \ge 2$ . For each reflex (d - 2)-dimensional face e of P, which is incident to facets  $f_1$  and  $f_2$ , it holds that  $f_1^B \cap f_2^B \neq \emptyset$ , unless  $\mathcal{W}_{\mathcal{V}}(\varepsilon) \neq \mathcal{W}_{\mathcal{S}}(\varepsilon)$  for some  $\varepsilon > 0$ .

From  $f_1^B \cap f_2^B \neq \emptyset$  it does not follow that  $f_1^B \cap f_2^B$  forms a (d-2)-dimensional face of B!

# Proper input shapes

### Definition

An input shape P in  $\mathbb{R}^d$  is called *proper* w.r.t. a proper unit ball B if

- (11) for each facet f of P there is a corresponding facet  $f^B$  of B whose outer normal vector is n(f) and
- (12) for all points p on all facets f of P, there is a point p' such that  $\inf_{q \in P} \|p' - q\|_B = \|p' - p\|_B > 0$  and  $p \in \operatorname{relint}_f (f \cap (p' + \|p' - p\|_B \partial B)).$

# Proper input shapes

### Definition

An input shape P in  $\mathbb{R}^d$  is called *proper* w.r.t. a proper unit ball B if

- (11) for each facet f of P there is a corresponding facet  $f^B$  of B whose outer normal vector is n(f) and
- (12) for all points p on all facets f of P, there is a point p' such that  $\inf_{q \in P} \|p' - q\|_B = \|p' - p\|_B > 0$  and  $p \in \operatorname{relint}_f (f \cap (p' + \|p' - p\|_B \partial B)).$

#### Lemma

For any proper input shape P w.r.t. B there is a finite point set S, with  $P \cap S = \emptyset$ , and some  $\varepsilon > 0$  such that  $\partial P \subseteq \partial(S \oplus \varepsilon B)$ .

# Corresponding reflex faces

#### Lemma

Let e be a reflex face of dimension k of a proper input shape P in  $\mathbb{R}^d$ , where  $0 \le k \le d-2$ . Then for any point  $p \in$  relint e there is a point  $p^B \in \partial B$  such that for some  $\varepsilon, \varepsilon' > 0$  the sets  $\partial P \cap (p + \varepsilon O)$  and  $\partial B \cap (p^B + \varepsilon' O)$  are homothetic, where O denotes the Euclidean unit ball. In particular, to e corresponds a k-dimensional face  $e^B$  of B with  $p^B \in$  relint  $e^B$ .

#### Theorem

For a proper input shape P w.r.t. a proper unit ball B in  $\mathbb{R}^d$  it holds that  $\mathcal{W}_{\mathcal{S}}(t) = \mathcal{W}_{\mathcal{V}}(t)$  for all  $t \ge 0$ .

A B A A B A

# Approximation by proper input shapes

#### Lemma

For any input shape P and any  $\varepsilon > 0$  there is proper input shape P' with  $P \subseteq P' \subseteq P \oplus \varepsilon O$ .
